

AI Resume Screening Platform

Intern Project Specification Document

CODAFRIQA | AI-Driven Technology & Engineering for Africa | www.codafriqa.rw

Project Type	Full-stack recruitment platform with resume processing, AI-assisted candidate matching, workflow management, interview scheduling, and analytics
Primary Users	Recruiters, recruitment managers, hiring managers, interviewers, system administrators, auditors, and job candidates
Implementation Model	Nine weekly milestones leading to a secure, deployable, and reviewable minimum viable product
Document Status	Version 1.0 - Intern Project Specification

1. Project Overview

The AI Resume Screening Platform is a recruitment management system that helps authorized recruitment teams review applications consistently and efficiently. Recruiters create or upload a job description, convert it into an approved set of job requirements, receive candidate resumes, and use artificial intelligence to compare each application against those requirements. The platform produces an evidence-based match assessment, explains how each result was reached, and supports the human recruitment team in deciding which candidates should move forward.

The platform is not intended to make autonomous employment decisions. Its purpose is to organize information, identify relevant evidence in resumes, highlight possible matches and gaps, and reduce repetitive manual review. Every shortlist, rejection, interview decision, and final recruitment outcome must remain under authorized human control and must be recorded with a clear reason and audit history.

The complete system must cover the recruitment workflow from job setup and resume submission through screening, recruiter review, candidate management, interview scheduling, feedback collection, communications, analytics, privacy controls, and final handover. The core deliverable must be a usable business application rather than a demonstration that only uploads a resume and returns a score.

2. Business Problem and Project Rationale

Recruitment teams frequently receive more applications than they can review quickly. Manual screening can become inconsistent, difficult to audit, and heavily dependent on how individual reviewers interpret a job description. Important candidates may be overlooked, while weak matches may advance because their resumes use familiar wording. Recruiters also lose time moving candidate information between email, spreadsheets, calendars, and disconnected interview notes.

This project addresses those challenges through one controlled recruitment workspace. Job requirements are structured and approved before screening begins; resumes are processed into reviewable candidate profiles; AI-generated assessments are supported by evidence from the application; and all decisions remain traceable to the responsible recruiter or hiring manager. The system must improve efficiency without replacing professional judgement, introducing prohibited discrimination, or hiding the reasons behind a recommendation.

3. Project Objectives

1. Build a secure, role-based recruitment platform that supports job setup, resume intake, AI-assisted screening, candidate management, interview scheduling, feedback, communications, and analytics.
2. Convert each job description into a structured and supervisor-approved screening rubric containing required qualifications, preferred qualifications, skills, experience, education, and configurable weighting rules.
3. Generate transparent candidate assessments that show the evidence, gaps, uncertainty, and scoring logic used for each recommendation.
4. Keep all employment decisions under authorized human review and provide a complete audit trail of automated assessments and human actions.
5. Protect candidate information through appropriate access control, consent, retention, secure file handling, and data-minimization practices.
6. Apply sound software engineering practices including modular design, validation, testing, error handling, documentation, deployment, monitoring, and reproducible configuration.
7. Deliver a practical system that can be configured for a small or medium-sized organization and safely extended after the core workflow is stable.

4. Scope and Completion Standard

4.1 Core Scope

- Secure user authentication, organization separation, role-based permissions, and auditable administrative actions.
- Job requisition and job-description management, including screening criteria, required and preferred qualifications, scoring weights, approval status, and version history.
- Candidate profiles, application records, resume uploads, document validation, text extraction, structured data review, duplicate detection, and recruitment history.
- AI-assisted skill matching, qualification assessment, candidate ranking, evidence display, gap identification, uncertainty handling, and human review controls.
- Recruiter workspace for searching, filtering, comparing, shortlisting, rejecting, tagging, commenting, assigning, and moving candidates through configurable recruitment stages.
- Interview scheduling, interviewer assignment, invitations, rescheduling, cancellation, feedback forms, scorecards, and recommendation capture.

- Recruiter and management dashboards covering pipeline status, screening activity, stage conversion, interview progress, processing time, and system quality indicators.
- Candidate and staff notifications, communication templates, delivery status, consent records, retention controls, audit logs, report exports, testing, deployment, and documentation.

4.2 Minimum Completion Standard

The project is considered functionally complete when an authorized recruiter can create an approved job and screening rubric, receive multiple candidate applications, review extracted resume information, run an explainable AI-assisted comparison, inspect evidence for every criterion, make and record a human screening decision, schedule interviews, collect interviewer feedback, move candidates through the recruitment pipeline, and view accurate dashboard information. The application must be deployed to a staging environment, tested against the acceptance requirements, and documented so another authorized team member can operate it.

4.3 Excluded from the Core Version

- Fully autonomous rejection, shortlisting, hiring, or offer decisions without authorized human approval.
- Face analysis, voice analysis, emotion detection, personality inference, lie detection, or any evaluation based on appearance or biometric characteristics.
- Scraping private social-media profiles or using unrelated personal information to evaluate employability.
- Inferring race, ethnicity, religion, health status, disability, pregnancy, political opinion, sexual orientation, or other sensitive personal characteristics.
- Background checks, payroll, employee onboarding, digital contracts, and full human-resource management functions.
- Large external job-board, calendar, assessment-provider, or enterprise HR integrations unless separately approved after the core platform is stable.

5. User Roles and Access Levels

Role	Primary Permissions
System Administrator	Manage organizations, users, roles, security settings, retention settings, integrations, system configuration, and audit records without making recruitment decisions unless separately authorized.
Recruitment Manager / HR Administrator	Manage recruitment teams and workflows, approve jobs and rubrics, oversee candidate pipelines, review analytics, manage templates, and authorize sensitive operational actions.
Recruiter	Create and manage jobs where permitted, review resumes and AI assessments, search and compare candidates, record screening decisions, communicate with candidates, and coordinate interviews.
Hiring Manager	Review approved candidates for assigned jobs, comment on job requirements, participate in shortlisting, view permitted evidence, and approve or reject progression decisions within assigned vacancies.

Role	Primary Permissions
Interviewer	View only assigned interview information, complete structured scorecards, submit comments and recommendations, and avoid access to unrelated candidate or compensation information.
Auditor / Read-Only Viewer	View approved reports, decisions, screening evidence, configuration history, and audit records without changing recruitment data.
Candidate	Submit an application and resume, provide required consent, receive permitted status updates and interview invitations, update limited contact information, and request correction or withdrawal where enabled.

6. Functional Requirements

Every requirement below must be implemented as a testable behavior. Permissions must be enforced in both the user interface and the underlying services; hiding an action in the interface is not sufficient authorization.

6.1 Authentication, Organization and Access Control

- Authorized staff must be able to sign in securely; credentials must never be stored in plain text.
- The system must support secure session handling, logout, session expiry, password reset, and account activation or suspension.
- Role-based authorization must be enforced on every protected operation, report, file, and service endpoint.
- Administrators must be able to create users, assign roles, limit users to permitted jobs or departments, and revoke access immediately.
- Data belonging to one organization must not be visible to another organization when the platform supports more than one organization.
- Sensitive account, permission, configuration, and data-access actions must be written to an immutable or tamper-evident audit history.

6.2 Job Requisition and Screening Rubric Management

- Recruiters or managers must be able to create, edit, duplicate, archive, and close job requisitions with title, department, location, employment type, description, responsibilities, and application dates.
- A job description must be converted into structured screening criteria before candidate ranking is permitted.
- Each criterion must identify its category, description, whether it is required or preferred, its weight, acceptable evidence, and any minimum threshold.
- Criteria must support skills, experience, education, certifications, language, work authorization where legally appropriate, location constraints, and other job-related requirements approved by the organization.
- The complete weighting must be validated so the calculation is understandable and internally consistent.
- The rubric must have draft, review, approved, and archived states. Only an approved version may be used for official screening.

- Changes to an approved rubric must create a new version, identify the editor and reason, and must not silently alter previous screening results.
- The system must provide a readable preview showing how the rubric will evaluate candidates before screening begins.

6.3 Candidate and Application Management

- Authorized users must be able to create, view, update, search, filter, tag, assign, archive, and export candidate and application records according to their permissions.
- A candidate may apply to more than one job, but each application must retain its own status, screening history, communications, interview records, and decision trail.
- The system must maintain contact information, source, application date, current stage, assigned recruiter, notes, tags, consent status, and permitted recruitment history.
- Potential duplicate candidates must be identified using controlled matching rules and presented for human review before records are merged.
- Recruiters must be able to add internal notes that are never shown to candidates and public notes or status messages where appropriate.
- Candidate stage changes must be recorded with actor, timestamp, previous stage, new stage, and reason where required.
- Bulk actions must require confirmation and must not bypass authorization, audit, or required reason capture.

6.4 Resume Upload, Validation and Processing

- Candidates and authorized staff must be able to upload resumes in approved document formats within configured size limits.
- The system must validate file type and size, reject unsafe or unsupported files, and store the original document securely with a unique reference.
- Uploaded documents must be checked for malicious content using an approved security process before they are made available to staff or processing services.
- The platform must extract readable text and identify structured information such as skills, employers, job titles, dates, education, certifications, projects, and languages where present.
- The original resume, extracted text, and normalized profile must remain linked so recruiters can verify automated extraction against the source document.
- Low-confidence or missing extraction results must be clearly marked for manual correction rather than silently guessed.
- Authorized recruiters must be able to correct extracted information without modifying the original document, and every correction must be auditable.
- A processing status must show whether a resume is queued, processing, completed, needs review, or failed, with safe retry behavior and an understandable error message.

6.5 AI-Assisted Candidate Matching and Ranking

- The screening process must compare each application only against the approved rubric for the selected job.
- The system must calculate criterion-level results and an overall assessment using the approved weighting and threshold rules.
- Each criterion result must show supporting evidence from the resume or application, the source location, the interpretation, the score contribution, and any uncertainty.
- Required criteria that are not evidenced must be displayed as missing or unverified; the system must distinguish absence of evidence from confirmed absence of a qualification.

- The system must identify matched skills, related or transferable skills, missing requirements, and ambiguous information that requires human review.
- Candidate ranking must be reproducible for the same job version, resume version, configuration, and AI version, or the system must explain why results changed.
- The platform must store the screening time, rubric version, resume version, system or model version, configuration, criterion outputs, overall result, and processing errors.
- Recruiters must be able to rerun screening after an approved change while retaining earlier results for comparison and audit.
- The system must not automatically reject or advance a candidate solely because of the AI result; a permitted human user must confirm the decision.
- A recruiter must be able to override a recommendation, but the final action must record the human reason and must not overwrite the original AI assessment.

6.6 Skill and Qualification Matching

- The platform must normalize common skill variations and abbreviations while preserving the wording found in the candidate document.
- Exact, related, transferable, and missing skills must be presented separately so recruiters can understand the type of match.
- Experience calculations must account for overlapping dates, incomplete dates, internships, part-time work, and gaps without inventing precision that is not supported by the resume.
- Education and certification matching must distinguish field of study, level, institution, completion status, validity dates where relevant, and equivalent qualifications where the approved rubric allows them.
- A user must be able to inspect the evidence behind every matched skill or qualification and correct the structured record when extraction is wrong.
- Job-related requirements must be evaluated consistently across all applicants to the same approved job version.

6.7 Human Review, Search, Comparison and Decisions

- Recruiters must have a work queue showing new, processing, review-required, screened, shortlisted, rejected, interview, offer, hired, and withdrawn applications according to the configured workflow.
- Users must be able to search and filter by job, stage, recruiter, score range, required-criterion status, skills, experience, education, application date, tags, and processing status.
- Candidate comparison must show the same approved criteria in the same order and must display evidence and uncertainty, not only total scores.
- Recruiters must be able to shortlist, reject, hold, advance, withdraw, or return an application to review, subject to permission and required reason rules.
- The system must support configurable decision reasons and free-text justification while preventing discriminatory or irrelevant decision categories.
- A final screening action must show the responsible human reviewer and must never be represented as an autonomous AI decision.
- Hiring managers must only view candidates and information associated with jobs assigned to them.

6.8 Interview Scheduling and Evaluation

- Authorized users must be able to create interview stages, select candidates, assign interviewers, propose or confirm date and time, specify timezone, location or meeting details, and add instructions.
- The system must detect scheduling conflicts within information available to it and require confirmation before double-booking an interviewer or candidate.

- Candidates and interviewers must receive approved invitations and updates for scheduling, rescheduling, or cancellation.
- Interview records must show status, participants, schedule, communication history, and permitted preparation materials.
- Interviewers must complete structured scorecards based on approved job-related criteria and may add evidence-based comments.
- Interview feedback must remain private from candidates unless an authorized user intentionally releases an approved message.
- The platform must prevent one interviewer from viewing another interviewer's submitted feedback before independent submission when that control is enabled.
- Recruiters and hiring managers must be able to review completed scorecards and record a documented progression decision.

6.9 Communications and Notifications

- The system must support approved templates for application acknowledgement, status updates, interview invitations, rescheduling, rejection, withdrawal confirmation, and other recruitment messages.
- Authorized users must be able to preview and edit permitted message fields before sending.
- Messages must record recipient, sender or system actor, template version, time, delivery status, and failure information.
- Failed notifications must be retried safely where appropriate and displayed to authorized users for follow-up.
- Internal notes, AI prompts, private reviewer comments, and other confidential information must never be inserted into candidate communications.
- Candidates must not be informed that a final employment decision was made solely by AI.

6.10 Recruiter Dashboard, Analytics and Reports

- The role-based dashboard must show active jobs, application volume, resumes awaiting processing, applications requiring review, stage distribution, upcoming interviews, and recent recruitment activity.
- Managers must be able to view time-to-screen, time-in-stage, stage conversion, interviewer completion, processing failure, and recruiter workload metrics for permitted jobs and periods.
- Users must be able to filter analytics by date range, job, department, recruiter, stage, and source where permitted.
- Screening quality indicators must include low-confidence extraction, manual corrections, recommendation overrides, failed processing, and disagreement between AI assessment and final human decision.
- Reports must be exportable in common business formats while respecting access permissions and privacy settings.
- Metric definitions must be documented and the same filters must produce consistent totals across dashboards and exports.
- Sensitive demographic analytics must not be included in the core version unless the organization has an approved legal, ethical, and access-control basis for collecting and using the data.

6.11 Candidate Privacy, Consent, Retention and Rights

- The candidate-facing process must present an understandable privacy notice and record the version accepted, timestamp, and relevant consent choices where required.
- The system must collect only information necessary for the recruitment purpose and must not require unrelated sensitive personal data.

- Authorized users must be able to configure retention periods by application status and apply archive, anonymization, or deletion workflows subject to organizational policy and applicable obligations.
- Candidate withdrawal, correction, access, or deletion requests must be tracked and routed to authorized staff for review and completion.
- Deleting or anonymizing a candidate must address resumes, extracted text, AI screening records, messages, exports, and other linked records according to the approved policy.
- Downloaded resumes and exported reports must be treated as controlled personal data and must be logged where required.
- The platform must not reuse candidate information to train or improve an AI system unless an explicit, approved governance basis exists.

6.12 Administration, Configuration and Audit

- Authorized administrators must be able to configure recruitment stages, decision reasons, job categories, scoring boundaries, interview scorecards, templates, retention settings, and organization branding.
- Configuration changes that can affect screening or decisions must record the old value, new value, actor, time, and reason.
- The audit log must support search by user, candidate, application, job, action type, and date range without allowing ordinary users to alter the history.
- Administrators must be able to view processing health, failed background tasks, notification failures, storage status, and integration status without exposing secrets.
- The system must support safe sample data and demonstration accounts that do not contain real candidate information.
- Critical actions such as changing a rubric, deleting candidate information, changing permissions, or performing a bulk decision must require confirmation.

7. Responsible AI and Recruitment Governance Requirements

Principle	Mandatory Requirement
Human Decision Authority	AI output must be decision support only. Authorized humans remain accountable for screening, shortlisting, interview, rejection, offer, and hiring decisions.
Job Relevance	The system must evaluate only approved, job-related criteria and must not use personal information that is irrelevant to the work.
Protected and Sensitive Attributes	The platform must not score, rank, or infer candidates using protected or sensitive characteristics. Such information must not be passed to the screening process unless an approved, lawful, and necessary exception is documented.
Proxy Risk	Design and testing must consider indirect proxies such as names, photographs, addresses, graduation years, and other information that may reveal or approximate sensitive characteristics.
Explainability	Every recommendation must show criterion-level reasoning and resume evidence in language a recruiter can understand and challenge.

Principle	Mandatory Requirement
Uncertainty	The system must clearly identify ambiguous, missing, low-confidence, or conflicting information and route it to human review.
Consistency	Candidates for the same job version must be assessed against the same criteria and configuration. Changes must create a new version and preserve previous results.
Fairness Evaluation	The team must test whether irrelevant changes to names or other non-job-related details alter screening results, and must investigate material inconsistencies before handover.
Candidate Transparency	The recruitment process must provide an appropriate explanation that automated assistance is used and preserve a channel for correction, questions, or human review where required.
No Hidden Learning	Candidate resumes, recruiter decisions, and interview feedback must not automatically become training data without approved governance, security, and documented authorization.
Prompt and Document Safety	Resume content must be treated as untrusted input. Instructions embedded inside a resume must not be allowed to change system rules, reveal confidential information, or manipulate scoring.
Monitoring and Review	Authorized users must be able to review errors, overrides, complaints, low-confidence cases, and unusual score patterns so the system can be corrected without silently changing historical decisions.

8. Core Data Model and Records

Entity	Minimum Information
Organization	Business identity, configuration, retention policy, branding, security settings, and data-isolation boundary.
User / Role / Permission	Staff identity, access status, assigned roles, job or department restrictions, and authentication information.
Job Requisition	Job details, ownership, status, dates, department, location, and associated approved screening rubric.
Rubric Version / Criterion	Required and preferred criteria, weights, thresholds, evidence rules, approval state, version, and change reason.
Candidate	Candidate identity, contact information, consent, source, tags, privacy requests, and permitted cross-application history.
Application	Candidate-to-job relationship, stage, assigned recruiter, status, decision history, notes, and relevant dates.
Resume Document	Original file reference, safe metadata, processing status, extracted text, version, checksum, and access history.

Entity	Minimum Information
Parsed Candidate Profile	Structured skills, employment, education, certifications, languages, projects, and manual corrections linked to source evidence.
Screening Run	Job rubric version, resume version, AI or system version, configuration, status, timestamps, total result, and error information.
Criterion Assessment	Criterion result, supporting evidence, source location, uncertainty, score contribution, and reviewer correction.
Recruitment Decision	Human action, decision type, reason, actor, time, previous stage, new stage, and link to the reviewed assessment.
Interview / Participant / Scorecard	Schedule, timezone, participants, status, meeting details, structured feedback, comments, and recommendation.
Communication	Template, sender, recipient, content version, related job or application, delivery state, and timestamps.
Consent / Privacy Request / Retention Action	Notice version, consent record, candidate request, decision, completion evidence, and deletion or anonymization action.
Audit Event	Actor, action, affected record, previous and new values where appropriate, timestamp, organization, and request context.

9. Non-Functional Requirements

Category	Requirement
Performance	Common pages and searches should respond within approximately 2-3 seconds under normal review load. Resume processing and AI screening may run asynchronously, but progress and completion status must remain visible.
Security	All data in transit must be encrypted. Sensitive data must be protected at rest. Authorization must be enforced on every service and file access path. Secrets must never be committed to source control.
Privacy	Candidate data must be collected, used, retained, exported, and deleted according to approved organizational policy and applicable data-protection obligations.
Fairness and Non-Discrimination	Screening must be based on approved job-related criteria. The project must include tests and review controls for inconsistent or discriminatory outcomes.
Explainability and Auditability	Automated and human actions that influence candidate progression must be traceable to the applicable criteria, evidence, version, actor, and time.
Reliability	Resume processing, screening, notifications, and scheduling must handle retries and partial failures without duplicating records or losing confirmed user actions.

Category	Requirement
Scalability	The design should support growth in jobs, candidates, documents, screening tasks, and organizations without requiring a complete redesign.
Usability	The interface must be clear for non-technical recruitment staff, provide confirmation for high-impact actions, and make AI evidence and uncertainty easy to inspect.
Accessibility	Core candidate and recruiter workflows should be keyboard usable, readable with assistive technologies, and designed with sufficient labels, focus behavior, and contrast.
Maintainability	The solution must separate concerns, use consistent naming and validation, document important design decisions, and include automated tests for high-risk logic.
Data Integrity	Database constraints, controlled status transitions, idempotent processing, and transaction handling must prevent duplicate, incomplete, or contradictory recruitment records.
Localization	Dates, timezones, phone numbers, text, and message templates must be structured so additional languages and regional formats can be added later.
Backup and Recovery	Automated backups must be configured for persistent data, with a tested restore procedure and documented recovery expectations.
Monitoring and Logging	Operational logs, processing failures, security events, and service health must be observable without recording passwords, secrets, full resumes, or unnecessary personal data.
File Safety	Resume storage and processing must enforce file validation, safe names, size limits, malware controls, access checks, and secure download behavior.

10. Key End-to-End Workflows

Workflow	Required Sequence
Job Approval	Recruiter drafts job -> manager reviews requirements -> rubric is structured and weighted -> approved version is locked for screening.
Candidate Application	Candidate or recruiter submits details and resume -> consent is recorded -> file is validated -> application and processing status are created.
Resume Processing	Safe document is queued -> text and structured data are extracted -> confidence issues are flagged -> recruiter verifies or corrects the profile.
AI-Assisted Screening	Approved rubric and verified application are selected -> criterion evidence is evaluated -> result and uncertainty are stored -> recruiter reviews the explanation.

Workflow	Required Sequence
Human Screening Decision	Recruiter compares evidence -> records shortlist, hold, reject, or progression decision -> reason and stage history are saved -> approved communication is sent.
Interview	Recruiter selects interview stage -> participants and schedule are confirmed -> invitations are sent -> interviewers submit independent scorecards -> hiring team records next action.
Candidate Privacy Request	Request is received -> identity and scope are reviewed -> linked data is identified -> approved action is completed -> evidence and communication are recorded.
Rubric Change	Manager proposes change -> new version is reviewed and approved -> future screening uses the new version -> previous results remain unchanged and comparable.

11. Technology Selection and Design Approval

This specification intentionally does not prescribe programming languages, frameworks, databases, AI providers, hosting services, or development tools. Interns must first demonstrate that they understand the business problem, recruitment workflow, data sensitivity, responsible-AI obligations, security risks, expected scale, and completion standard. Technology choices must follow that understanding rather than determine it.

- Before implementation, the intern must prepare a concise technical proposal covering the proposed architecture, major components, data model, resume-processing approach, AI-assessment approach, access-control model, background processing, testing strategy, deployment approach, monitoring, estimated costs, limitations, and important risks.
- The proposal must explain why the selected approach is suitable for maintainability, security, privacy, explainability, reliability, available skills, expected workload, and the company's operating environment.
- The intern must identify any external service that would receive candidate data, what data it receives, where it is processed or stored where known, how credentials are protected, and what fallback exists if the service is unavailable.
- The assigned supervisor must approve the technical direction before substantial implementation begins.
- A major change to an approved architecture, data flow, AI provider, storage method, security control, or deployment approach must be discussed with and approved by the supervisor.
- Where a requirement is unclear, the intern must ask the supervisor rather than selecting a technology or changing scope based on an assumption.

12. Mandatory Company GitHub and Supervision Rules

Rule	Mandatory Requirement
GitHub Username	Each intern must submit the exact GitHub username that will be used for the project before repository access is granted. The username must remain clearly attributable to that intern throughout the work.

Rule	Mandatory Requirement
Repository Ownership	All official project work must be completed in a GitHub repository owned by the company or the assigned supervisor. A personal repository, another organization's repository, or an unapproved duplicate must not be used as the official project location.
Repository Access	The intern must confirm that the assigned repository can be accessed before creating project files. Access problems must be reported immediately to the supervisor.
Regular Pushes	Work must be committed and pushed regularly throughout the internship. A final bulk upload, local-only project, or unexplained replacement of repository history is not acceptable.
Meaningful History	Commits must be reasonably focused and clearly described so supervisors can understand progress, review changes, and identify the author.
Branches and Reviews	The intern must follow the repository branching, pull-request, code-review, issue, and approval process communicated by the company or supervisor.
No Secrets or Personal Data	Passwords, access tokens, private keys, real candidate resumes, confidential recruitment records, and other sensitive information must never be committed to the repository.
Company Ownership and Continuity	Source code, documentation, configuration templates, designs, tests, and related materials produced during the internship must remain available in the company- or supervisor-controlled repository.
Supervisor Communication	Whenever a requirement, workflow, rule, permission, technical decision, result, or expected behavior is not understood, the intern must contact the assigned supervisor for clarification instead of guessing or silently changing the scope.
Blocking Issues	Any issue that prevents meaningful progress, including missing access, failed processing, unclear requirements, security concerns, or external-service problems, must be reported promptly with enough evidence for the supervisor to assist.

13. Suggested Weekly Milestones

Week	Focus	Expected Outcome
Week 1	Project Understanding and Supervisor Approval	Study the full specification; restate the business problem and boundaries; prepare user roles, end-to-end workflows, scope interpretation, data model, responsible-AI controls, risks, assumptions, questions, and a technical proposal; provide the GitHub username, confirm repository access, and resolve supervisor feedback before implementation.
Week 2	System Foundation, Jobs and Candidate Records	Create the approved project structure in the assigned repository; establish secure configuration and documentation foundations; implement users, roles, organization separation, job requisitions, rubric drafting and approval, candidate profiles, applications, stages, and audit-event foundations.
Week 3	Resume Intake and Structured Profile Processing	Implement secure resume upload, file validation, processing status, text extraction, structured skills, experience, education and certification records, source evidence, manual correction, duplicate review, and failure handling.
Week 4	AI Matching, Ranking and Responsible-AI Controls	Implement criterion-level matching, evidence display, missing and uncertain information, weighting, overall ranking, result versioning, human override, prompt/document safety, protected-attribute controls, reproducibility, and a controlled AI evaluation set.
Week 5	Recruiter Review and Candidate Pipeline	Build recruiter work queues, search, filters, candidate comparison, assignment, notes, tags, shortlisting, rejection, stage transitions, decision reasons, bulk-action safeguards, hiring-manager access, and complete human-decision audit trails.
Week 6	Interview Scheduling, Scorecards and Communications	Implement interview stages, scheduling, timezones, participant assignment, conflict checks, invitations, rescheduling, cancellation, structured scorecards, independent feedback controls, candidate notifications, templates, delivery tracking, and failure follow-up.
Week 7	Dashboards, Administration, Privacy and Reporting	Implement role-based dashboards, pipeline and quality metrics, exports, workflow configuration, screening settings, audit search, consent records, privacy requests, retention and anonymization workflows, operational health, and safe demonstration data.

Week	Focus	Expected Outcome
Week 8	Testing, Security, Reliability and Deployment	Complete unit, integration, workflow, responsible-AI, security, file-safety, privacy, performance, backup, recovery, error-handling, and acceptance tests; correct defects and deploy the approved staging environment.
Week 9	Stabilization, Documentation and Handover	Verify every acceptance criterion; improve usability; prepare approved sample accounts, jobs and resumes; complete architecture, setup, API, data, AI, security, testing, deployment and user documentation; demonstrate the full recruitment workflow and document next-phase recommendations.

14. Testing and Acceptance Requirements

- Unit tests must cover permission decisions, rubric validation, score calculations, status transitions, retention rules, interview conflicts, and human-approval requirements.
- Integration tests must cover database changes, organization isolation, file storage and retrieval, resume processing, screening persistence, notifications, scheduling, exports, audit events, and important failure and retry paths.
- End-to-end tests must cover job approval, candidate application, resume processing, recruiter correction, AI-assisted screening, evidence review, human decision, interview scheduling, feedback, candidate communication, reporting, and privacy requests.
- The AI evaluation set must include strong matches, weak matches, transferable skills, missing evidence, ambiguous dates, overlapping employment, unusual resume layouts, unsupported instructions embedded in resumes, and deliberately irrelevant personal details.
- Fairness checks must compare equivalent resumes in which non-job-related identifying details are changed. Material score or ranking differences must be investigated, corrected, or clearly documented before handover.
- Security testing must include unauthorized record access, cross-organization access, insecure file types, oversized files, filename manipulation, malicious document content, secret exposure, rate abuse, and permission changes.
- Recruiters must be able to trace every official recommendation to an approved rubric version and resume evidence, and every progression decision to an authorized human actor.
- No critical or high-severity security, privacy, data-loss, or discriminatory-behavior defect may remain open at handover. Lower-severity limitations must be documented with impact and recommended correction.
- A new authorized team member must be able to start, configure, and evaluate the system by following the repository documentation and safe sample configuration without undocumented manual steps.

15. Deliverables

- A fully working AI Resume Screening Platform covering job and rubric management, candidate applications, secure resume processing, AI-assisted matching, human review, candidate pipeline management, interview scheduling, feedback, communications, analytics, privacy controls, and administration.

- A staging deployment accessible for review with separate approved sample accounts for administrator, recruitment manager, recruiter, hiring manager, interviewer, auditor, and candidate workflows.
- All source code and project documentation in the assigned company- or supervisor-owned GitHub repository, with clear commit history, README, safe configuration template, architecture explanation, data model, API documentation, and database change history.
- Approved sample jobs, rubrics, synthetic candidate profiles, and non-confidential resumes that demonstrate different match levels and edge cases.
- A documented AI evaluation set and results covering accuracy, evidence quality, uncertainty, prompt/document safety, consistency, and fairness checks.
- Automated unit, integration, API, security, and end-to-end tests covering the most important functional, privacy, and responsible-AI requirements.
- A repeatable API test collection or equivalent testing evidence, plus safe seed data or setup scripts for evaluation.
- A deployment guide, backup and restore procedure, configuration checklist, operational monitoring notes, external-service inventory, and documented data-flow and privacy considerations.
- A short live or recorded demonstration following the complete job-to-application-to-screening-to-interview workflow.
- A concise technical report describing design decisions, AI approach, scoring method, human oversight, security and privacy controls, evaluation results, limitations, and recommended next phase.

16. Future Enhancements After Core Completion

The following capabilities should be considered only after the core recruitment workflow is stable, tested, secure, and deployed. They are not required for the first complete version unless separately approved by the assigned supervisor.

Enhancement	Possible Next-Phase Capability
External Job Channels	Approved integrations with company career pages, job boards, professional networks, email intake, and recruitment agencies.
Calendar and Meeting Integrations	Two-way synchronization with approved calendar and video-meeting services, automated availability suggestions, and reminder workflows.
Candidate Self-Service Portal	Secure profile updates, application tracking, document replacement, interview availability, privacy requests, and message history.
Multilingual Resume Processing	Additional resume languages, language-specific extraction evaluation, translated recruiter views, and multilingual candidate communications.
Skills Assessments	Job-related technical tests, questionnaires, practical assignments, score import, proctoring controls where appropriate, and evidence integration.
Talent Pool and Rediscovery	Consent-based candidate pools, future-role matching, expiry controls, re-contact workflows, and recruiter recommendations.

Enhancement	Possible Next-Phase Capability
Offer and Onboarding Handover	Offer approvals, document generation, electronic acceptance, reference checks, background-check workflow, and secure transfer to an HR system.
Advanced Fairness Monitoring	Approved aggregate monitoring, threshold comparison, adverse-impact review, explanation quality review, and governance reporting with strict access controls.
Interview Intelligence	Approved transcription, structured summaries, competency evidence extraction, and interviewer support without emotion, personality, or biometric inference.
Workforce Planning Analytics	Hiring forecasts, vacancy aging, skill-gap trends, source quality, recruitment cost analysis, and department planning dashboards.
Advanced AI Evaluation	Model comparison, controlled experiments, automated regression evaluation, drift monitoring, cost optimization, and formal approval workflows for model changes.
Enterprise Integrations	Approved connections to HR management, identity, document management, assessment, background-check, and business-intelligence platforms.

17. Notes for the Intern

- Do not begin by building pages from the short project description. First understand the recruitment problem, users, decision points, job criteria, candidate data, responsible-AI boundaries, failure cases, privacy risks, and completion standard.
- Submit the required GitHub username promptly and confirm that access to the assigned company- or supervisor-owned repository works before project files are created.
- Keep the assigned repository current throughout the project. Work that exists only locally, in a personal repository, or in an unapproved copy cannot be treated as properly submitted project work.
- Build one complete vertical slice early: approved job rubric -> safe resume upload -> extracted evidence -> criterion assessment -> recruiter review -> recorded human decision. Expand only after this path works reliably.
- Do not treat a high AI score as proof that a candidate is suitable, and do not treat missing resume evidence as proof that a candidate lacks the qualification. Preserve uncertainty and require professional review.
- Design fairness, privacy, access control, auditability, and human oversight from the beginning. These controls are difficult to add safely after the application becomes large.
- Use realistic but synthetic or otherwise approved sample candidate information. Never commit credentials, private keys, real resumes, confidential recruitment records, or personal data to the repository.
- Whenever any requirement, result, risk, or technical decision is not understood, record the question and contact the assigned supervisor. Interns must not guess, hide a blocking issue, or silently change the approved scope.
